42 Lecture - CS301

Important Mcqs

1. What is collision in computer science?

- A. A situation where a program crashes
- B. A situation where two or more data items end up at the same memory location
- C. A situation where a program encounters a syntax error
- D. A situation where a program encounters a logical error

Answer: B

2. Which of the following data structures can experience collisions?

- A. Linked lists
- B. Arrays
- C. Hash tables
- D. Stacks

Answer: C

3. What is the impact of collisions on data structure performance?

- A. Faster access times
- B. Slower access times
- C. Increased data security
- D. Decreased memory consumption

Answer: B

4. What is chaining in collision handling?

- A. Resolving a collision by allocating new memory
- B. Resolving a collision by reorganizing the data structure
- C. Resolving a collision by deleting the collided data item
- D. Resolving a collision by linking the collided data items together

Answer: D

5. Which of the following is a disadvantage of chaining?

- A. It requires less memory
- B. It can result in longer access times
- C. It can result in data loss
- D. It requires more processing power

Answer: B

6. Which of the following is a disadvantage of open addressing?

- A. It requires more memory
- B. It can result in longer access times
- C. It can result in data loss
- D. It requires more processing power

Answer: A

7. What is linear probing in open addressing?

A. Resolving a collision by rehashing the key

- B. Resolving a collision by allocating new memory
- C. Resolving a collision by searching sequentially for an empty slot
- D. Resolving a collision by randomly selecting a new memory location

Answer: C

8. What is quadratic probing in open addressing?

- A. Resolving a collision by rehashing the key
- B. Resolving a collision by allocating new memory
- C. Resolving a collision by searching sequentially for an empty slot
- D. Resolving a collision by incrementing the probe step by a quadratic function of the previous step

Answer: D

9. Which of the following is an example of a hash function?

- A. Sorting algorithm
- B. Linear search
- C. Bubble sort
- D. MD5

Answer: D

10. What is the purpose of a hash function in collision handling?

- A. To reduce the number of collisions
- B. To increase the number of collisions
- C. To increase the memory consumption
- D. To decrease the access time

Answer: A
